

Taller Netflix Simian Army

1. Estrategias Chaos Monkey

- **shutdowninstance:** Cierra la instancia utilizando la API EC2.
- **blockallnetworktraffic:** Esto elimina todos los grupos de seguridad de la instancia y lo mueve a un grupo de seguridad que no permite ningún acceso.
- **burncpu:** Este mono ejecuta procesos intensivos de CPU, simulando un vecino ruidoso o una CPU defectuosa.
- **killprocesses:** Este mono mata todos los programas de Java o Python que encuentra cada segundo, simulando una aplicación defectuosa, instalación dañada o instancia defectuosa.
- **nullroute:** Este mono enruta nula la red 10.0.0.0/8, que es utilizada por la red interna EC2.
- **failec2:** Este mono coloca entradas de host ficticias en / etc / hosts, de modo que toda la comunicación de la API EC2 fallará.
- **faildns:** Este mono usa iptables para bloquear el puerto 53 para TCP y UDP; Esos son los puertos de tráfico DNS.
- **faildynamodb:** Este mono coloca entradas de host ficticias en / etc / hosts, de modo que toda la comunicación de DynamoDB fallará.
- **fails3:** Este mono coloca entradas de host ficticias en / etc / hosts, de modo que toda la comunicación S3 fallará.
- **networkcorruption:** Este mono usa la API de modelado de tráfico para destruir una gran fracción de los paquetes de red.
- **networklatency:** Este mono utiliza la API de configuración de tráfico para introducir latencia (1 segundo + - 50%) a todos los paquetes de red.
- **networkloss:** Este mono usa la API de modelado de tráfico para descartar una fracción de todos los paquetes de red.

2. Reglas del Janitor Monkey

- **orphanedInstanceRule:** Esta propiedad especifica si Janitor monkey limpiará las instancias huérfanas.
- **orphanedInstanceRule.instanceAgeThreshold:** Una instancia huérfana se marca como candidato de limpieza si se ha iniciado durante más de la cantidad de días especificada en esta propiedad.
- **orphanedInstanceRule.retentionDaysWithOwner:** Esta propiedad especifica el número de días hábiles que se retiene la instancia después de que se envía una notificación sobre la finalización cuando la instancia tiene un propietario.
- **orphanedInstanceRule.retentionDaysWithoutOwner:** Esta propiedad especifica el número de días hábiles que se retiene la instancia después de que se envía una notificación sobre la finalización cuando la instancia no tiene un propietario.
- **oldDetachedVolumeRule:** Esta propiedad especifica si Janitor monkey limpiará los volúmenes separados.
- **oldDetachedVolumeRule.detachDaysThreshold:** Un volumen se considera un candidato de limpieza después de ser separado por el número de días especificado en esta propiedad.

- **oldDetachedVolumeRule.retentionDays:** Esta propiedad especifica el número de días hábiles que se retiene el volumen después de que se envía una notificación sobre la finalización.
- **noGeneratedAMIRule:** Esta propiedad especifica si Janitor monkey limpiará las instantáneas sin referencia.
- **noGeneratedAMIRule.ageThreshold:** Una instantánea sin referencia se considera un candidato de limpieza después del lanzamiento durante el número de días especificado en esta propiedad.
- **noGeneratedAMIRule.retentionDays:** Esta propiedad especifica el número de días hábiles que se retiene la instantánea después de que se envía una notificación sobre la finalización.
- **noGeneratedAMIRule.ownerEmail:** Esta propiedad especifica un correo electrónico de propietario de anulación al limpiar las instantáneas de EBS con esta regla.
- **Eureka:** La propiedad a continuación especifica si Eureka / Discovery está disponible o no para que lo use Janitor monkey. Discovery / Eureka se usa en las reglas para limpiar grupos de autoescalado para determinar si un grupo de autoescalado tiene una instancia 'activa', es decir, una instancia que está registrada y activada en Discovery / Eureka.
- **oldEmptyASGRule:** Esta propiedad especifica si Janitor monkey limpiará los grupos de escalado automático vacíos.
- **oldEmptyASGRule.launchConfigAgeThreshold:** Un grupo de escalado automático sin instancias activas se considera un candidato de limpieza cuando su configuración de inicio es anterior al número de días especificado en esta propiedad.
- **oldEmptyASGRule.retentionDays:** El número de días hábiles que se retiene un grupo de escalado automático vacío después de que se envía una notificación para la finalización.
- **suspendedASGRule:** Esta propiedad especifica si Janitor monkey limpiará los grupos de escalado automático suspendidos.
- **suspendedASGRule.suspensionAgeThreshold:** Un grupo de escalado automático sin instancias activas se considera un candidato de limpieza cuando se ha suspendido del tráfico ELB asociado durante el número de días especificado en esta propiedad.
- **suspendedASGRule.retentionDays:** Esta propiedad especifica el número de días hábiles que se retiene el grupo de escalado automático después de que se envía una notificación para la finalización.
- **oldUnusedLaunchConfigRule:** Esta propiedad especifica si Janitor monkey limpiará las configuraciones de inicio no utilizadas que tengan más de ciertos días de antigüedad.
- **oldUnusedLaunchConfigRule.ageThreshold:** Una configuración de inicio no utilizada se considera un candidato de limpieza cuando es anterior al número de días especificado en la propiedad a continuación.
- **oldUnusedLaunchConfigRule.retentionDays:** Esta propiedad especifica el número de días hábiles que se mantiene la configuración de inicio después de que se envía una notificación para la finalización.

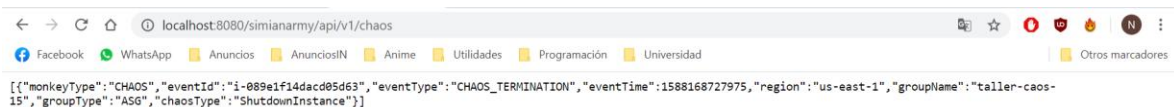

3. Reglas del Conformity Monkey

- **Eureka:** Esta propiedad es para habilitar las reglas de conformidad que necesitan acceder a Eureka for Conformity Monkey.
- **SameZonesInElbAndAsg:** Esta propiedad se utiliza para permitir que la regla de conformidad verifique si no hay coincidencia de zonas de disponibilidad entre cualquier grupo de escalado automático y sus equilibradores de carga elásticos en un clúster.

- **InstanceInSecurityGroup:** Esta propiedad se usa para permitir que la regla de conformidad verifique si todas las instancias en un clúster están en grupos de seguridad requeridos.
- **InstanceInSecurityGroup.requiredSecurityGroups:** Esta propiedad especifica los grupos de seguridad necesarios en la regla de conformidad InstanceInSecurityGroup.
- **InstanceTooOld:** Esta propiedad se usa para permitir que la regla de conformidad verifique si hay alguna instancia que sea anterior a ciertos días.
- **InstanceTooOld.instanceAgeThreshold:** Esta propiedad especifica el número de días utilizados en el InstanceInSecurityGroup, cualquier instancia que sea anterior a este número de días se considera no conforme.
- **InstanceInVPC:** Esta propiedad se utiliza para habilitar la regla de conformidad para verificar si sus instancias están en una Nube privada virtual de Amazon (VPC).
- **InstanceHasStatusUrl:** Esta propiedad se utiliza para habilitar la regla de conformidad para verificar si todas las instancias en el clúster tienen una URL de estado definida en Discovery / Eureka.
- **InstanceHasHealthCheckUrl:** Esta propiedad se utiliza para habilitar la regla de conformidad para verificar si todas las instancias en el clúster tienen una URL de verificación de estado definida en Discovery / Eureka.

4. Traza de ejecuciones del Chaos Monkey

- Usando la configuración de una (1) sola terminación por día, el monkey terminó una instancia de aws. Después de la terminación de la instancia, gracias al autoscaling configurado, se volvió a crear una nueva instancia que reemplace a la terminada.

- En esta oportunidad se modificó las reglas de escalamiento colocando cinco (5) instancias funcionando paralelamente. Adicionalmente, el monkey se configuro para ejecutarse cada minuto y con una configuración de 10000 terminaciones por día.
